

Staff you may meet

Radiation Oncologists

specialist doctors who prescribe your radiation therapy.

Radiation Therapists

plan and deliver your radiation therapy, offer support and advice.

Radiation Oncology Nurses

oversee your wellbeing during treatment, offer support and advice.

Radiation Oncology Medical Physicists

ensure the treatment machines work correctly and that your treatment plan is accurate.

Cancer Care Coordinators

arrange patient care and ensure you have access to other information and support services.

Dietitians

provide nutritional support and advice.

Social Workers

provide emotional and practical support and assist in accessing community services.

Speech Pathologists

provide expert support and clinical advice.

Reception staff

are the first point of contact in the centre and can assist you with appointments and general information.

Guide to: Radiation Therapy Services

Northern NSW
Local Health District

Northern NSW Radiation therapy services

Radiation therapy is one of the main ways to treat cancer. Treatments, including radiation therapy, chemotherapy or surgery, are used for different cancers and can be used together. Radiation therapy uses radiation to kill or injure cancer cells and stop them multiplying.

Stages of Radiation therapy

Initial consultation

Your radiation oncologist will go through your treatment options and their benefits and risks.

We welcome questions. It's fine if you want to talk to family or friends after the appointment before making any decisions about treatment.

Simulation

Your 'Treatment Simulation' appointment includes imaging scans on a CT and possibly an MRI scanner. This appointment can take a few hours. We may ask you to prepare by drinking water before the session.

If you have a pacemaker, a defibrillator or any other implantable electronic device or if you think you may be pregnant, please let us know beforehand.

Accuracy is very important in radiation therapy. To reduce side effects we help you lie in exactly the same position each day for treatment. We find this position during simulation. To help reproduce that position, we may make 2-3 small, permanent ink

You will have scheduled appointments with your radiation oncologist throughout your treatment and weekly assessments by nursing staff. Radiation therapists will give you your treatment. There are many staff available to support you. Please tell us how you are feeling and if you need advice or help.

marks on your skin. We might also make equipment to help keep you in position.

Planning

It may be a few weeks between your simulation session and the start of your treatment. This gives us time to design and check your treatment plan. We design a customised plan to suit your needs.

Treatment

A course of radiation therapy can take between 1-8 weeks. If you need particular appointment times, please discuss this with us as early as possible.

Your daily radiation therapy includes many checks such as x-rays, scans and several measurements. This is so treatment is accurate and we can make changes if needed.

It's very important to keep still during treatment.

Follow up

After finishing radiation therapy you will receive a plan that includes follow up phone calls and meetings with your radiation oncology team.

External Beam Radiation therapy

There are different types of radiation therapy. We use external beam radiation therapy. This is similar to X-rays.

You are only exposed to radiation when the machine is switched on. The radiation is aimed precisely at the part of the body that requires treatment. The rest of your body receives little or no radiation. You do not become radioactive as a result of the treatment.

Side Effects

Short term side effects are possible from the treatment. We will explain the side effects that you could expect.

Radiation therapy is very precise so any side effects will usually be at the site of treatment. You may feel tired during treatment.

Most people can continue doing their normal daily activities during treatment.
